Combinatorial Optimization

Single Source Shortest Path
(Dijkstra's Algorithm)

Shortest Path Problems

- **What is shortest path ?**
 - shortest length between two vertices for an unweighted graph:
 - smallest cost between two vertices for a weighted graph:

Shortest Path Problems

- How can we find the shortest route between two points on a map?
- Model the problem as a graph problem:
 - Road map is a weighted graph:
 - vertices** = cities
 - edges** = road segments between cities
 - edge weights** = road distances
 - Goal: find a shortest path between two vertices (cities)

Shortest Path Problems

- **Input:**

- Directed graph $G = (V, E)$
- Weight function $w : E \rightarrow \mathbf{R}$

- **Weight of path $p = \langle v_0, v_1, \dots, v_k \rangle$**

$$w(p) = \sum_{i=1}^k w(v_{i-1}, v_i)$$

- **Shortest-path weight from u to v :**

$$\delta(u, v) = \min \begin{cases} w(p) : u \xrightarrow{p} v & \text{if there exists a path from } u \text{ to } v \\ \infty & \text{otherwise} \end{cases}$$

- Shortest path u to v is any path p such that $w(p) = \delta(u, v)$

Variants of Shortest Paths

- **Single-source shortest path**

- $G = (V, E) \Rightarrow$ find a shortest path from a given source vertex s to each vertex $v \in V$

- **Single-destination shortest path**

- Find a shortest path to a given destination vertex t from each vertex v
- Reverse the direction of each edge \Rightarrow single-source

- **Single-pair shortest path**

- Find a shortest path from u to v for given vertices u and v
- Solve the single-source problem

- **All-pairs shortest-paths**

- Find a shortest path from u to v for every pair of vertices u and v

Optimal Substructure of Shortest Paths

Given:

- A weighted, directed graph $G = (V, E)$
- A weight function $w: E \rightarrow \mathbf{R}$,
- A shortest path $p = \langle v_1, v_2, \dots, v_k \rangle$ from v_1 to v_k
- A subpath of p : $p_{ij} = \langle v_i, v_{i+1}, \dots, v_j \rangle$, with $1 \leq i \leq j \leq k$

Then: p_{ij} is a shortest path from v_i to v_j

Proof: $p = v_1 \xrightarrow{p_{1i}} v_i \xrightarrow{p_{ij}} v_j \xrightarrow{p_{jk}} v_k$

$$w(p) = w(p_{1i}) + w(p_{ij}) + w(p_{jk})$$

Assume $\exists p_{ij}'$ from v_i to v_j with $w(p_{ij}') < w(p_{ij})$

$\Rightarrow w(p') = w(p_{1i}) + w(p_{ij}') + w(p_{jk}) < w(p)$ **contradiction!**

Shortest-Path Representation

For each vertex $v \in V$:

- $d[v] = \delta(s, v)$: a **shortest-path estimate**
 - Initially, $d[v] = \infty$
 - Reduces as algorithms progress
- $\pi[v] =$ **predecessor** of v on a shortest path from s
 - If no predecessor, $\pi[v] = \text{NIL}$
 - π induces a tree—**shortest-path tree**
- Shortest paths & shortest path trees are not unique

Initialization

Alg.: INITIALIZE-SINGLE-SOURCE(V, s)

1. **for** each $v \in V$
2. **do** $d[v] \leftarrow \infty$
3. $\pi[v] \leftarrow \text{NIL}$
4. $d[s] \leftarrow 0$

- All the shortest-paths algorithms start with INITIALIZE-SINGLE-SOURCE

Relaxation

- **Relaxing** an edge (u, v) = testing whether we can improve the shortest path to v found so far by going through u

If $d[v] > d[u] + w(u, v)$

we can improve the shortest path to v

\Rightarrow update $d[v]$ and $\pi[v]$

After relaxation:
 $d[v] \leq d[u] + w(u, v)$

RELAX(u, v, w)

1. **if** $d[v] > d[u] + w(u, v)$
 2. **then** $d[v] \leftarrow d[u] + w(u, v)$
 3. $\pi[v] \leftarrow u$
-
- All the single-source shortest-paths algorithms
 - start by calling INIT-SINGLE-SOURCE
 - then relax edges
 - The algorithms differ in the order and how many times they relax each edge

Dijkstra's Algorithm

- Single-source shortest path problem:
 - No negative-weight edges: $w(u, v) > 0 \forall (u, v) \in E$
- Maintains two sets of vertices:
 - S = vertices whose final shortest-path weights have already been determined
 - Q = vertices in $V - S$: min-priority queue
 - Keys in Q are estimates of shortest-path weights ($d[v]$)
- Repeatedly select a vertex $u \in V - S$, with the minimum shortest-path estimate $d[v]$

Dijkstra (G, w, s)

1. INITIALIZE-SINGLE-SOURCE(V, s)
2. $S \leftarrow \emptyset$
3. $Q \leftarrow V[G]$
4. **while** $Q \neq \emptyset$
5. **do** $u \leftarrow \text{EXTRACT-MIN}(Q)$
6. $S \leftarrow S \cup \{u\}$
7. **for** each vertex $v \in \text{Adj}[u]$
8. **do** RELAX(u, v, w)

Example

Dijkstra's Pseudo Code

- Graph G , weight function w , root s

DIJKSTRA(G, w, s)

```
1 for each  $v \in V$ 
2     do  $d[v] \leftarrow \infty$ 
3  $d[s] \leftarrow 0$ 
4  $S \leftarrow \emptyset$   $\triangleright$  Set of discovered nodes
5  $Q \leftarrow V$ 
6 while  $Q \neq \emptyset$ 
7     do  $u \leftarrow \text{EXTRACT-MIN}(Q)$ 
8          $S \leftarrow S \cup \{u\}$ 
9         for each  $v \in \text{Adj}[u]$ 
10             do if  $d[v] > d[u] + w(u, v)$ 
11                 then  $d[v] \leftarrow d[u] + w(u, v)$ 
```

relaxing
edges

Dijkstra (G, w, s)

1. INITIALIZE-SINGLE-SOURCE(V, s) $\leftarrow \Theta(V)$
2. $S \leftarrow \emptyset$
3. $Q \leftarrow V[G] \leftarrow O(V)$ build min-heap
4. **while** $Q \neq \emptyset \leftarrow$ Executed $O(V)$ times
5. **do** $u \leftarrow \text{EXTRACT-MIN}(Q) \leftarrow O(\lg V)$
6. $S \leftarrow S \cup \{u\}$
7. **for** each vertex $v \in \text{Adj}[u]$
8. **do** RELAX(u, v, w) $\leftarrow O(E)$ times; $O(\lg V)$

Running time: $O(V \lg V + E \lg V) = O(E \lg V)$

Dijkstra's Running Time

- Extract-Min executed $|V|$ time
- Decrease-Key executed $|E|$ time
- Time = $|V| T_{\text{Extract-Min}} + |E| T_{\text{Decrease-Key}}$
- T depends on different Q implementations

Q	T(Extract -Min)	T(Decrease- Key)	Total
array	$O(V)$	$O(1)$	$O(V^2)$
binary heap	$O(\lg V)$	$O(\lg V)$	$O(E \lg V)$
Fibonacci heap	$O(\lg V)$	$O(1)$ (amort.)	$O(V \lg V + E)$

Question

- Prove that, if there exists negative edge, dijkstra's shortest path algorithm may fail to find the shortest path
- Print the shortest path for dijkstra's algorithm
- How many shortest paths are there from source to destination?
- Suppose you are given a graph where each edge represents the path cost and each vertex has also a cost which represents that, if you select a path using this node, the cost will be added with the path cost. How can it be solved using Dijkstra's algorithm?

Question

- How to solve ACM534 – Frogger?
